Measurement Archive Interchange Specification

This fictional laboratory specification is a conversion and review fixture. All names, rules, numerical limits and diagrams are invented. It is not a source of electrical or safety requirements.

Contents

1. Exchange and record scope 1
1.1 Capture boundary 1
1.1.1 Attribution 1
1.2 Definition rules 2
2. Measurement record matrix 3
3. Parameter settings and expressions 4
4. Duration bands and continued records 5
4.1 Continued table and note scope 6
5. Derived measures and literal transcription 7
Annex K (informative) Review paths, figure evidence and independent verification of retained archive records 8
K.1 Decision diagram 8
K.2 Verification graph and units 9
Annex L (informative) Composite expression records 10
Annex M (informative) Submitted record cover and abstract 11

The document uses printed labels i, 1 through 12. A physical PDF page index is a different identifier.

1. Exchange and record scope

The archive shall retain the submitted record, its source location and the sequence in which the reviewer encountered it. Each reconstruction shall retain links to the same immutable input. A successful conversion reports execution status; it does not certify that every value, relationship or note has been recovered.

1.1 Capture boundary

A capture boundary encloses a page region and its explicit relationships. The boundary may include a caption, a body paragraph and a group of cells. A line drawn through a region is not, by itself, evidence that two values belong to different records.

1.1.1 Attribution

The original spelling, capitalization and symbols remain part of the source evidence. If a source value appears unusual, the reviewer shall retain it and record a separate explanation. The conversion shall not replace a literal zero with a missing value or normalize a strict inequality into a non-strict one.

The trace follows the submitted item[17] even when the note appears below.

NOTE 1 - The following note is explanatory body content. It remains associated with the section and is not a title, caption, running head or page footer.

Retention remains mandatory after a successful conversion.

Record order is distinct from physical drawing order. A visual paragraph can be assembled from many PDF text runs, while a single run may contain both a numerical value and a raised callout. The corresponding roles shall be reviewed without discarding the underlying glyphs.

17 A page note identifies contextual evidence; the marker is not a decimal suffix.

1.2 Definition rules

capture window: The bounded interval used to select incoming records.

review token: An identifier used to preserve the source-to-result relationship.

record boundary: The visual region belonging to one submitted item.

retained evidence: The original text, image and relationships used for comparison.

NOTE 2 - Definitions use bold terms followed by colons. Their typography does not create a new section in the document hierarchy.

Review participants

Alex Rowan	Indigo Reed	Oakley Frost
Casey Marlow	Jordan Wren	Parker Dawn
Devin Solace	Kendall Fox	Quinn Brook
Ellis Parker	Logan Birch	Reese Field
Finley Hart	Morgan Lake	Sage North
Harper Vale	Noel Ash	Taylor Moss

The three columns are a roster of independent fictional participants. There are no row-wise pairs between columns and no data header.

2. Measurement record matrix

Table 1 records quantities at two observation scales. Units and relation signs belong to each value. The table notes and the page note below use different marker spaces.

Table 1. Fictional observation envelope

Parameter	Steady observations			Transient observations		
	Accuracy	**Window**	**Range**	**Accuracy**	**Window**	**Range**
Amplitude	± 0.7% A	12 cycles	0.4 ≤ u ≤ 1.3	± 1.4% A	3 cycles	0.0 < u < 1.5
Rate	± 0.03 Hz	48 cycles	47.5 to 52.5 Hz	N/A	N/A	Not required
Active score	± 3% B	9 cycles	0.15 < p < 0.95	0	-	N/A
Reactive score	± 3% B	9 cycles	0.15 < q < 0.95	0	-	N/A
Interval	± 0.4 ms	N/A	80 ms < t < 4 s	± 0.8 ms	N/A	0 < t ≤ 6 s

a Values in this table describe fictional recorder behavior, not electrical limits.

b The literal dash is a recorded symbol; an empty field is a different state.

The observation matrix is retained with its notes.

18 The page note belongs to this page, not to a table column or a numerical range.

3. Parameter settings and expressions

Table 2. Fictional archive settings

Parameter	Default settings		Allowed settings	
	Profile A	**Profile B**	**Minimum**	**Maximum**
Capture floor	≥ 0.932 u[a]	≥ 0.941 u	0.90 u	0.98 u
Delay factor	$\frac{2.4}{u - 0.68}$		$\min(0.6, \frac{1}{r})$	
Review path	Archive stream		TCP	Ethernet
	Archive stream		N/A	RS-422
Record status	protcol pending			0

a The raised a is a local note marker and is not part of the value 0.932.

The source intentionally spells the status as "protcol pending". A corrected spelling would be a separate editorial operation.

Fractions and min operators are embedded within cells. Their presence does not turn the table into a stand-alone display equation.

19 A table expression must be compared as mathematical content as well as visible glyphs.

4. Duration bands and continued records

Table 3. Fictional retention bands

Record band	Mode	Minimum retention	Maximum reaction
u > 1.24	Reject	0.12 s	0.12 s
1.16 < u ≤ 1.24	Review	0.8 s	N/A
0.86 ≤ u ≤ 1.16	Retain	Infinite	N/A
0.58 ≤ u < 0.86	Review	min(2.8, 1/r) s	N/A
u < 0.58	Suspend	0.18 s	0.18 s

a A retention interval is not the same as a reaction interval.

A record within the retained band remains associated with its source. A boundary value is assigned according to the direction and strictness of the printed relation sign. The endpoint 1.16 occurs in adjacent conditions but belongs to one specified band.

The next physical page defines note [121] and continues Table 3.

When a record is divided across physical pages, its reference remains attached to the same logical item. The continuation begins with the remaining words of the

same sentence and does not create a new section merely because a running head intervenes.

4.1 Continued table and note scope

Table 3. Fictional retention bands (continued)

Record band	Mode	Minimum retention	Maximum reaction
r > 6.4 Hz	Reject	0.22 s	0.22 s
5.6 < r ≤ 6.4 Hz	Review	3.2 s	N/A
4.2 ≤ r ≤ 5.6 Hz	Retain	Infinite	N/A
r < 4.2 Hz	Suspend	0.4 s	0.4 s

b Lettered table notes remain local to the continued logical table.

The continued table does not introduce a second independent Table 3.

121 This note is called out on the preceding physical page. Its marker is not the value 121 of a measured quantity.

The archive retains both table fragments and the cross-page note.

5. Derived measures and literal transcription

The two expressions below are invented review metrics. Each right-aligned parenthesized number identifies one expression. Neither expression supplies an electrical engineering requirement.

$$J = \sum_{k=2}^{7} \frac{a_k^2}{1 + k^2} \tag{1}$$

$$R = \frac{\sqrt{A_{rms}^2 - A_0^2}}{A_{base}} \times 100\% \tag{2}$$

In these fictional expressions, J is a review index and R is a normalized residual. The terms rms, base and the integer zero are distinct subscripts; they are not footnote markers.

Table 4. Fictional sequence groups

Sequence group	2 ≤ k < 18	18 ≤ k < 45[107]	Residual (%)
Allowed score	3.4	0.7	4.6

107 The upper bound is forty-five; the raised 107 is the note identifier.

The literal label "calbration" is preserved exactly as submitted.

Annex K
(informative)
Review paths, figure evidence and independent verification of retained archive records

K.1 Decision diagram

Figure K.1 is an invented review decision path. Internal words and edge labels are figure content. Recovering an image is distinct from recovering its graph connections.

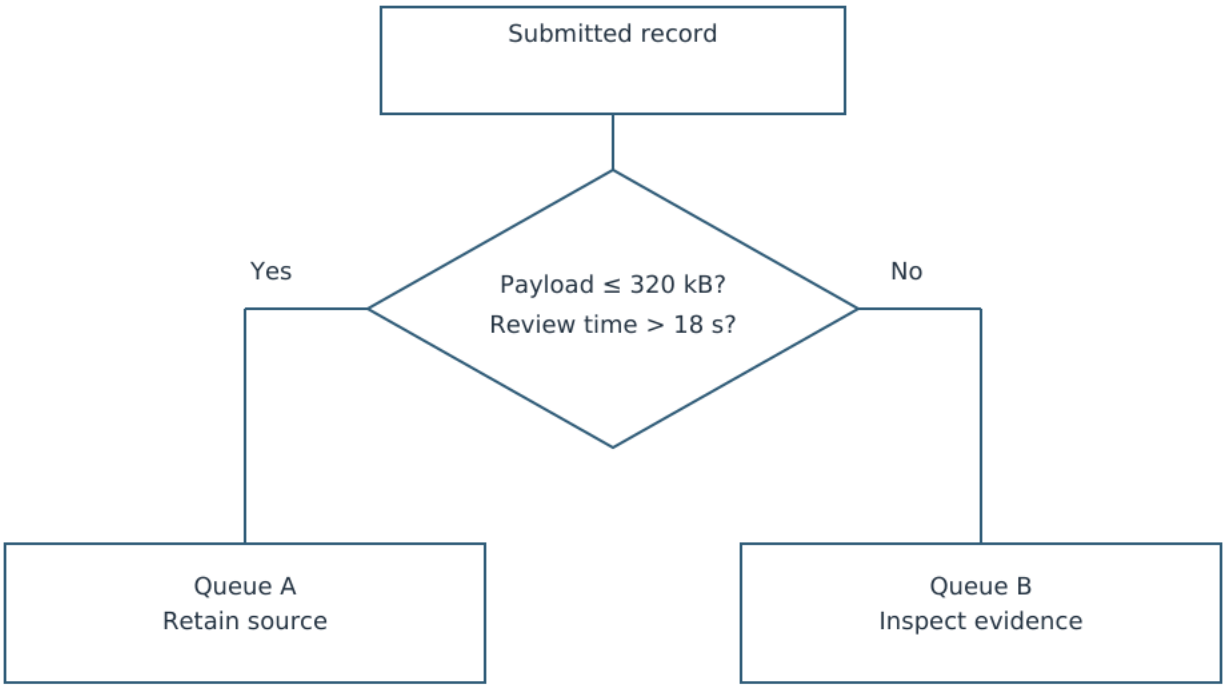

Figure K.1. Fictional review decision path

The internal threshold labels must not become body paragraphs in the reading sequence. Image preservation alone does not prove that the labels or edges were recognized.

K.2 Verification graph and units

Figure K.2 depicts a fictional archive fill ratio. The plotted curve, axis signs, units and inequality callouts belong to the same figure.

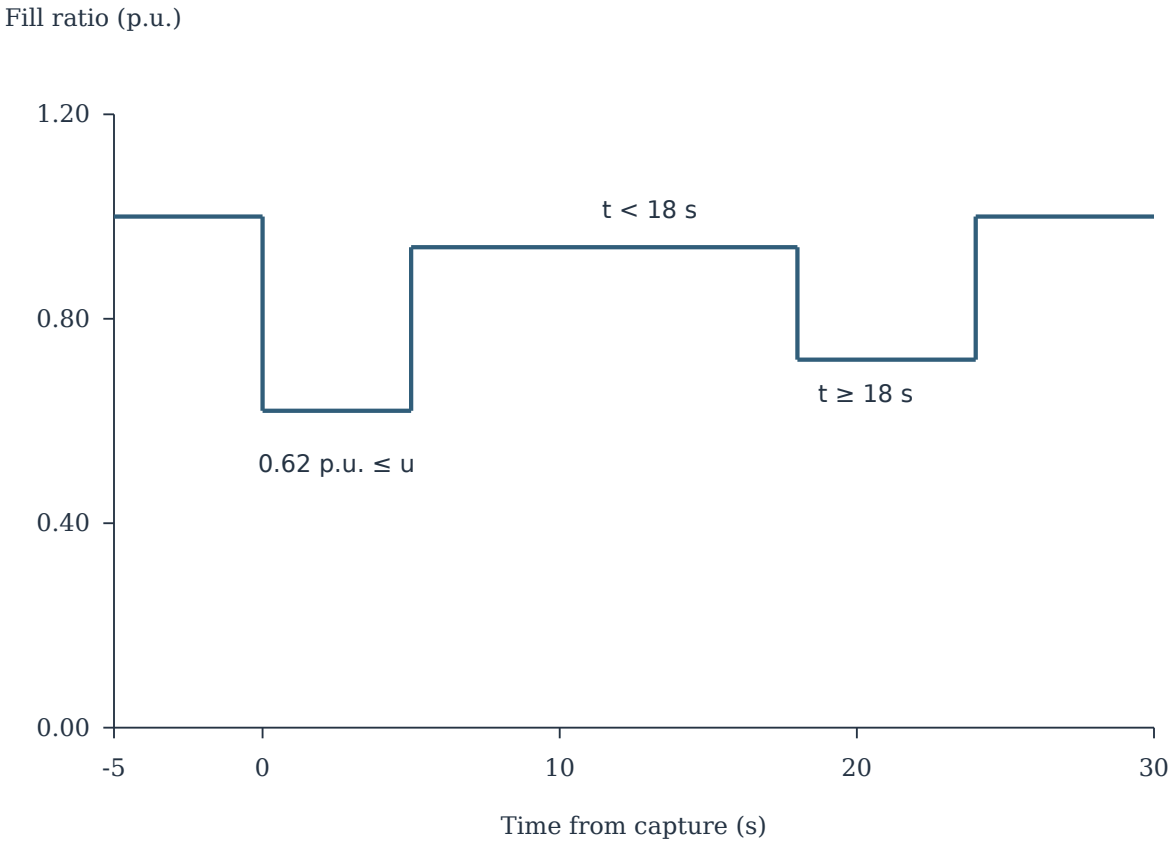

Figure K.2. Fictional archive fill sequence

NOTE 3 - This explanatory note belongs to the figure discussion. It is not the figure caption and is not a running footer.

The final retained record includes the original source, the extraction, the unresolved differences and the reviewer decision. Repeated words do not authorize deletion of a body paragraph.

Annex L
(informative)
Composite expression records

L.1 Conditional values and note scope

Table L.1. Fictional conditional record values

Record expression	Mathematical value	Unit
Upper response bound	$\min_{u>0.62}\left\{\frac{4.1}{u-0.62}, 9.0\right\}$	s
Lower response bound	$\max_{r<1.8}\left\{\frac{1-r}{c_0}, 0.15\right\}$	s

$$\Theta = \sqrt[3]{\sum_{j=2}^{9} b_j^{3}} \tag{3}$$

The root index is 3. The radical covers the full sum, and the exponent on each indexed term is also 3.

Table L.2. Route A

Field	Value
Threshold	0.73[a]

a This marker belongs only to Route A.

Table L.3. Route B

Field	Value
Threshold	0.86[a]

a This marker belongs only to Route B.

Identical marker letters do not establish that two notes are the same note.

Submitted record cover and abstract

Archive Verification Record

Revision 04 / Laboratory record MA-27

Sponsor
Measurement Archive Interchange Working Group

Approved 10 November 2026

MAIS Review Council

Abstract: This fictional record describes how a laboratory archive retains submitted evidence, establishes source identity and records unresolved extraction differences. The review covers text roles, numerical symbols, mathematical expressions and the relationships between a submitted item and its source region.

Keywords: archive, source identity, traceability, table, review, evidence.

The cover identifies the issuing council. This abstract describes the record contents. Their physical adjacency does not establish that they form a single paragraph.

A true paragraph continuation is provided earlier in this fixture. Both cases use a physical page boundary and repeated page furniture, but their paragraph identities differ.
